ABOUT THE MEETING

The Vestibular-Oriented Research Meeting was created to unite the vestibular research community, bringing together leading and aspiring researchers from around the world to share and build knowledge, unify our diverse transdisciplinary specialty, and transform and improve interactions within our community as well as within independent and/or parallel disciplines.

This year's conference will be a satellite meeting following the American Academy of Neurology (AAN) meeting in Toronto. We hope to showcase a diverse range of researchers including neurologists, physical and occupational therapists, otologists, audiologists and basic scientists.

Content will focus on neurological aspects of vestibular function, including neurological vestibular problems like traumatic brain injury and vestibular migraine, therapeutic topics like neural adaptation, as well as basic neuroscience topics like vestibular aging, balance, sensory integration, autonomic influences and vestibulo-ocular reflexes.
